US-09-663-326-10
Sequence 10, Application US/09663326
Patent No. 6617497
GENERAL INFORMATION:
APPLICANT: MORTIS Ph.D., Roy O.
TITLE OF INVENTION:
FILE REFRENCE: UMO199-15
PRIOR APPLICATION NUMBER: US/09/663,326
CURRENT FILING DATE: 2000-09-15
PRIOR APPLICATION NUMBER: 60/054,268
PRIOR APPLICATION NUMBER: 60/054,268
PRIOR APPLICATION NUMBER: 60/054,268
PRIOR APPLICATION NUMBER: 00/054,268
PRIOR APPLICATION NUMBER: 00/054,268
PRIOR PILING DATE: 1997-07-30
NUMBER OF SEQ ID NOS: 20
SOFTWARE: Patentin Ver. 2.0
LENGTH: 1602
TYPE: UNA
CREANISM: Zea mays
FEATURE:

Description

WPI; 2002-130736/17

Polynucleotide encoding novel plant protein having cytokinin oxidase activity and the protein useful for stimulating root growth, enhancing the formation of lateral or adventitious roots, altering root geotropism.

Claim 2; Page 146-147; 154pp; English.

The invention relates to an isolated polynucleotide (I) encoding a novel plant protein (II) having cytokinin oxidase activity. (I) is useful for production of transgenic plants, plant cells or tissues; for production of altered plants, plant cells or tissues; for production of altered plants, plant cells or tissues; and for effecting the expression of (II) where (I) is operably linked to one or more control sequences. The methods further comprises regenerating a plant from the plant cell. (I) and (II) are useful for stimulating a plant from the plant cell. (I) and (II) are useful for stimulating root growth, enhancing the formation of lateral or adventitious roots; altering root geotropism, leading to an increase in yield, and for screening growth promocting chemical of herbicides. (I) is useful for increasing the size of the shoot meristem; delaying leaf sensescence and altering leaf sensescence; inducing parthenocarpy, improving standability of the seedlings; inducing parthenocarpy, improving standability of the seedlings; increasing and for improving lodging resistance. Antibody (III) to (II) is useful for identifying and obtaining proteins interacting with (II) cassay ABKS8603 Appresent Arabidopsis thaliana cytokinin oxidase coding sequences and PCR primers of the invention

```

The present invention relates to a method for stimulating root growth or enhancing the formation of lateral or adventitious roots or altering root geotropism, which comprises increasing in a plant or plant part the level of a plant cytokinin oxidase or other protein that reduces the level of active cytokinins in a plant or plant part. Cytokinin oxidase protein and coding sequences from Arabidopsis thaliana are also provided. The method is useful in modifying plant morphological) biochemical and physiological properties, such as in modifying the initiation, stimulation or enhancement of root growth, adventitious root formation, lateral root formation, root geotropism, shoot growth, apical dominance, branching, timing of senescence, timing of flowering, flower formation, seed development and/or seed yield. The present sequence is a coding sequence shown in the invention Stimulating root growth, enhancing lateral or adventitious root formation or altering root geotropism comprises increasing plant cytokinin oxidase levels or other protein or nucleic acid that reduces active cytokinins in a plant. Claim 3; Page 167-168; 177pp; English.

Sequence 1506 BP; 431 A; 328 C; 324 G; 423 T; 0 U; 0 Other;

The invention relates to an isolated polynucleotide (I) encoding a novel plant protein (II) having cytokinin oxidase activity. (I) is useful for production of transpanic plants, plant cells or tissues; for production of altered plants, plant cell or tissues; and for effecting the corrected plants, plant cell or tissues; and for effecting the corrected plants, plant cell or tissues; and for effecting the corrected plants. Plant (II) where (I) is operably linked to one or more control sequences. The methods further comprises regenerating a plant from the plant cell. (I) and (II) are useful for stimulating root growth, conditions the formation of lateral or adventitious roots, altering root geotropism, leading to an increase in yield, and for screening growth correcting chemical of herbicides. (I) is useful for increasing the size of the shoot meristem; indreasing root size, increasing the size of the shoot meristem; delaying leaf senescence and altering leaf senescence; inducing parthenocarpy; improving lodging transing proteins interacting with (II) is useful for improving lodging resistance. Antibody (III) comprising a screening assay, preferably a two-hybrid screening assay. ABK28606-ABK28631 represent Arabidopsis thaliana cytokinin oxidase coding sequences and PCR primers of the invention

Cytokinin oxidase protein and coding sequences from Arabidopsis thaliana are also provided. The method is useful in modifying plant morphological, biochemical and physiological properties, such as in modifying the initiation, stimulation or enhancement of root growth, adventitious root formation, lateral root formation, soetzoet geotropism, shoot growth, apical dominance, branching, timing of senescence, timing of flowering, flower formation, seed development and/or seed yield. The present sequence is a coding sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising: (a) contacting nucleic acid array expresentative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing buth increased tolerance to abloric stress. The present sequence is that of an Arabidopsis thaliana stress required gene (ABZ12196-ABZ17574) used not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office

The invention relates to an isolated polynucleotide (I) encoding a novel plant protein (II) having cytokinin oxidase activity. (I) is useful for production of transgenic plants, plant cells or tissues; for production of altered plants, plant cell or tissues; and for effecting the expression of (II) where (I) is operably linked to one or more control sequences. The methods further comprises regenerating a plant from the plant cell. (I) and (II) are useful for stimulating root growth; canhanding the formation of lateral or adventitious roots altering root promoting the formation of lateral or adventitious roots, altering root geotropism, leading to an increase in yield; and for screening growth promoting chemical of herbicides. (I) is useful for increasing the size of the root meristem; increasing root size; increasing the size of the shoot meristem; dedicing senescence and altering leaf senescence; inducing parthenocarpy; improving lodging resistance. Antibody (III) increasing branching and for improving lodging resistance. Antibody (III) (II) is useful for identifying and obtaining proteins inneracting with (II) comprising a screening assay, preferably a two-hybrid screening assay. ABK28606-ABK28603 represent Arabidopsis thaliana cytokinin oxidase coding sequences and PCR primers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          444
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 264

Identifying at least one gene involved in plant resistance or response pathogenic infection for conferring resistance or tolerance to a plant bacterial, fungal or viral infection by determining or detecting plant

```
The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        144
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             324

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for stimulating root growth or enhancing the formation of lateral or adventitious roots or altering root geotropism, which comprises increasing in a plant or plant part the level of a plant cytokinin oxidase or other protein that reduces the level of active cytokinins in a plant or plant part. Cytokinin oxidase protein and coding sequences from Arabidopsis thaliana are also provided. The method is useful in modifying plant morphological, biochemical and physiological properties, such as in modifying the initiation, stimulation or enhancement of root growth, adventitious root formation, lateral root formation, root geotropism, shoot growth, apical dominance, branching, timing of senescence, timing of flowering, flower formation, seed development and/or seed yield. The present sequence is a coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Stimulating root growth, enhancing lateral or adventitious root formation or altering root geotropism comprises increasing plant cytokinin oxidase levels or other protein or nucleic acid that reduces active cytokinins in

The invention relates to an isolated polynucleotide (I) encoding a novel plant protein (II) having cytokinin oxidase activity. (I) is useful for production of transgenic plants, plant cells or tissues; for production of altered plants, plant cells or tissues; for production of altered plants, plant cells or tissues; and for effecting the expression of (II) where (I) is operably linked to one or more control sequences. The methods further comprises regenerating a plant from the plant cell. (I) and (II) are useful for stimulating root growth; enhancing the formation of lateral or adventitious roots growth; contained to an increase in yield; and for soreening growth promoting chemical of herbicides. (I) is useful for increasing the size of the broot meristem; increasing root size, increasing the size of the commerstem; delaying leaf ensescence and altering leaf senescence; increasing leaf thickness; reducing or increasing the vessel size; increasing branching and for improving lodging resistance. Antibody (III) is useful for identifying and obtaining proteins interacting with (II) is useful for identifying and obtaining proteins interacting with (II) comprising a screening assay, pareferably a two-hybrid screening essay. ABK28606-ABK28631 represent Arabidopsis thaliana cytokinin oxidase coding sequences and PCR primers of the invention

```
The present invention relates to a method for stimulating root growth or enhancing the formation of lateral or adventitious roots or altering root geotropism, which comprises increasing in a plant part the level of a plant cytokinin oxidase or other protein that reduces the level of active cytokinin a plant or plant part. Cytokinin oxidase protein and coding sequences from Arabidopsis thaliana are also provided. The method is useful in modifying plant morphological, biochemical and physiological properties, such as in modifying the initiation, stimulation or enhancement of root growth, adventitious root formation, lateral root formation, root geotropism, shoot growth, apical dominance, branching, timing of senescence, timing of flowering, flower formation, seed development and/or seed yield. The present sequence is a coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Stimulating root growth, enhancing lateral or adventitious root formation or altering root geotropism comprises increasing plant cytokinin oxidase levels or other protein or nucleic acid that reduces active cytokinins in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an isolated polynucleotide (I) encoding a novel plant protein (II) having cytckinin oxidase activity. (I) is useful for production of transgenic plants, plant cells or tissues; for production of altered plants, plant cell or tissues; and for effecting the expression of (II) where (I) is operably linked to one or more control sequences. The methods further comprises regenerating a plant from the plant cell. (I) and (II) are useful for stimulating root growth; enhancing the formation of lateral or adventitious roots; altering root
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polynucleotide encoding novel plant protein having cytokinin oxidase activity and the protein useful for stimulating root growth, enhancing the formation of lateral or adventitious roots, altering root geotropism
                                                                                                                                                                                                                                                                                                 SerLysArgLysAspLeuPheAspProLysLysLeuLeuSerProGlyGlnAspIlePhe

geotropism, leading to an increase in yield; and for screening growth promoting chemical of herbicides. (I) is useful for increasing the size of the root meristem; increasing root size; increasing the size of the shoot meristem; delaying leaf senescence and altering leaf senescence; increasing leaf thickness; reducing or increasing the vessel size; increasing barthenocarpy; improving etandability of the seedlings; increasing branching and for improving lodging resistance. Antibody (III) to (II) is useful for identifying and obtaining proteins interacting with (II) computation a screening assay, preferably a two-hybrid screening assay. ABK28666-ABK28663 represent Arabidopsis thaliana cytokinin oxidase coding sequences and PCR primers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                167
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                552
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                187

```
The present invention relates to a method for stimulating root growth or enhancing the formation of lateral or adventitious roots or altering root geotropism, which comprises increasing in a plant or plant part the level of a plant cytokinin oxidase or other protein that reduces the level of active cytokinins in a plant or plant part. Cytokinin oxidase protein and coding sequences from Arabidopsis thalians are also provided. The method is useful in modifying plant morphological, bicchemical and physiological properties, such as in modifying the initiation, stimulation or enhancement of root growth, adventitious root formation, lateral root formation, root geotropism, shoot growth, apical dominance, branching, timing of senescence, timing of flowering, flower formation, seed development and/or seed yield. The present sequence is a coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    252

The invention relates to an isolated polymucleotide (I) encoding a novel plant protein (II) having cytokinin oxidase activity. (I) is useful for production of transgenic plants, plant cells or tissues; for production of altered plants, plant cell or tissues; and for effecting the caxpression of (II) where (I) is operably linked to one or more control sequences. The methods further comprises regenerating a plant from the plant cell. (I) and (II) are useful for stimulating root growth, chancing the formation of lateral or adventitious roots; altering root geotropism, leading to an increase in yield; and for screening growth comprises, leading to an increase in yield; and for screening growth comprise in conting chemical of herbicides. (I) is useful for increasing the size of the shoot meristem; increasing root size; increasing the size of the contincreasing leaf thickness; raddicing or increasing the size of the increasing parthenocarpy; improving standability of the seedlings; increasing branching and for improving lodging resistance. Antibody (III) comprising as screening assay, preferably a two-hybrid screening assay. ABK28606-ABK28633 represent Arabidopsis thaliana cytokinin oxidase coding sequences and PCR primers of the invention
